Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG).

(3) $\mathcal{L}_1$ is a linear space over $\mathbb{R}$ with the inner product

2

2014.03.26

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher for the 10-trial condition than for the 5-trial condition. Error bars represent the standard error of the mean.

مجلس الشورى

1. <i>Chlorophyll a</i> (Chl a) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum. Chl a is located in the thylakoid membranes of chloroplasts. 2. <i>Chlorophyll b</i> (Chl b) is an accessory pigment that absorbs light energy in the blue and orange-red regions of the visible spectrum. It is located in the thylakoid membranes of chloroplasts and transfers energy to Chl a. 3. <i>Carotenoids</i> are a group of pigments that absorb light energy in the blue and green regions of the visible spectrum. They are located in the thylakoid membranes of chloroplasts and transfer energy to Chl a. Carotenoids also protect the photosynthetic apparatus from damage by reactive oxygen species. 4. <i>Xanthophylls</i> are a group of carotenoids that absorb light energy in the blue and green regions of the visible spectrum. They are located in the thylakoid membranes of chloroplasts and transfer energy to Chl a. Xanthophylls also play a role in the regulation of photosynthesis. 5. <i>Phycobilins</i> are a group of pigments that absorb light energy in the blue and red regions of the visible spectrum. They are located in the phycobilisomes of cyanobacteria and transfer energy to Chl a.	6. <i>Anthocyanins</i> are a group of pigments that absorb light energy in the blue and green regions of the visible spectrum. They are located in the vacuoles of plant cells and give plants a red, purple, or blue color. Anthocyanins also have antioxidant properties. 7. <i>Flavonoids</i> are a group of pigments that absorb light energy in the blue and green regions of the visible spectrum. They are located in the vacuoles of plant cells and give plants a yellow, orange, or red color. Flavonoids also have antioxidant properties. 8. <i>Chalcones</i> are a group of pigments that absorb light energy in the blue and green regions of the visible spectrum. They are located in the vacuoles of plant cells and give plants a yellow, orange, or red color. Chalcones also have antioxidant properties. 9. <i>Isoprenoids</i> are a group of pigments that absorb light energy in the blue and green regions of the visible spectrum. They are located in the vacuoles of plant cells and give plants a yellow, orange, or red color. Isoprenoids also have antioxidant properties. 10. <i>Terpenoids</i> are a group of pigments that absorb light energy in the blue and green regions of the visible spectrum. They are located in the vacuoles of plant cells and give plants a yellow, orange, or red color. Terpenoids also have antioxidant properties.
